HOMEFIRST FINANCE · OUTSIDE-IN ASSESSMENT

Growth, returns and operating capacity

An assessment from public disclosures to Q2 FY27 (30 Sep 2026). Management commentary to 28 Oct 2026; information cutoff 30 Oct 2026.

As the book doubles, HomeFirst's surplus equity gets put to work; return on assets and operating capacity become the risks

1

WHAT THE EVIDENCE SHOWS

ROE is temporarily diluted by surplus equity

ROA has risen to 4.2%, solid for a 5% spread lender. ROE is 14.9% because the ₹1,250 Cr QIP in FY26 lowered leverage to 3.6x.

Open question

Does ROA hold as the equity is deployed into larger tickets and new markets?

2

WHAT THE SCENARIOS IMPLY, ON STATED ASSUMPTIONS

Doubling the book deploys that capital

At 25% annual growth from FY26, AUM roughly doubles by FY29 and reaches 2.4x by FY30. Retained earnings grow about 14–16% a year, so leverage rises to about 4.5x and ROE to about 18%. On the stated capital assumptions, neither case indicates a near-term equity requirement.

Open question

What quality and cost of growth does the doubling path require?

3

WHERE THE RISKS SIT

Return on assets and operating capacity carry the risk

In the scenarios, debt-funding the larger book costs 23–35 bps of ROA by FY30; the draft insurance rule puts up to 35 bps more at risk. In the downside ROE stays near 15%. Disbursals reach 2.4x their FY26 level by FY30, while output per employee has been flat for three years.

Open question

Can growth be absorbed through higher output per employee?

What public data cannot establish: headcount and effort by function; yield, credit cost and roll rates by segment, channel and cohort; connector cost and credit performance; measured outcomes of the AI tools.

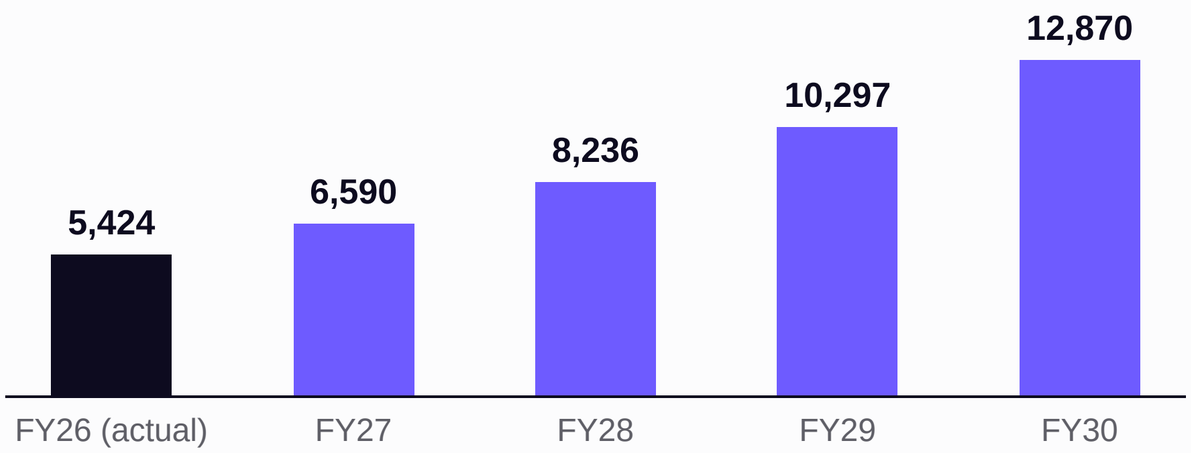

Source: HomeFirst Q2 FY27 investor presentation, results and earnings call; FY26 Integrated Annual Report; Aistra outside-in model (appendix A3–A4). Financial data to 30 Sep 2026 (Q2 FY27); market data and management commentary to 28 Oct 2026.

04	**Peers**	Observed differences in business model and returns	11
05	**Capabilities and unknowns**	What HomeFirst has deployed and what public data cannot show	13
06	**Assessment conclusion**	What the evidence supports, what the scenarios imply, what remains unknown	14
A	**Appendix**	Sources, sensitivities, scenario and capital assumptions, peer detail, shareholder returns	15

At 25% annual growth from FY26, AUM roughly doubles by FY29 and reaches 2.4x by FY30; a constant-productivity sensitivity gives 3,700–4,200 staff against 2,014

Disbursals needed for 25% AUM growth, ₹ Cr a year

Needed disbursals = growth in AUM + 16.5% run-off of opening AUM (management assumes 16–17%; FY26 implied 17.8%, Q2 FY27 annualised 14.9%).

Where growth comes from

Ticket size	New loans average ₹15–16 lakh against ₹12.3 lakh on the book; loans above ₹25 lakh rose from 14% to 18% of the book in a year
Volume	About half of disbursal growth; Madhya Pradesh rose from 9.1% to 11.2% of AUM in a year
New markets	UP, Tamil Nadu, Andhra Pradesh, Telangana; 20–25 branches a year, 62 more planned

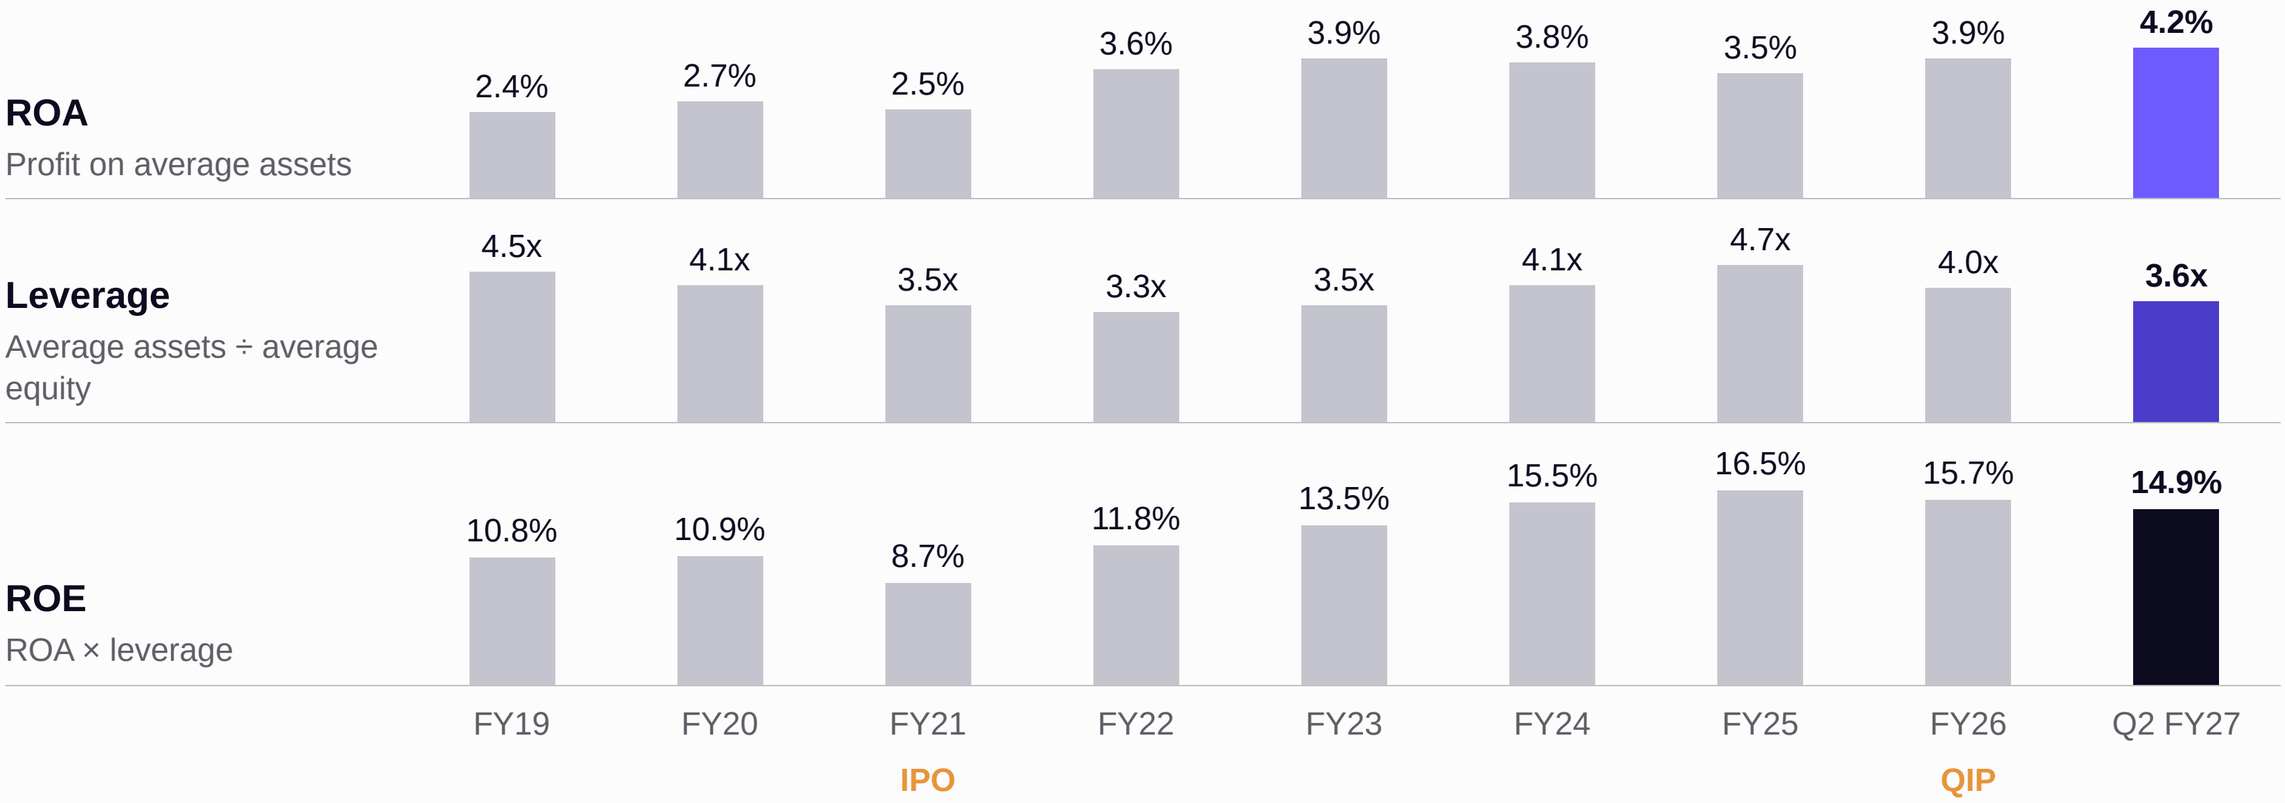

What could constrain it

Productivity	₹3.1–3.5 Cr disbursed per employee a year, flat for three years; attrition 32.8%
Employee cost	₹71.06 Cr in Q2 (₹284 Cr annual run-rate), 67% of opex; staffing and cost by function undisclosed
Southern markets	Staged self-construction lending slows growth; Tamil Nadu fell from 12.1% to 10.0% of AUM

Constant-productivity staffing sensitivity, not a forecast: FY30 disbursals ÷ the current disclosed productivity range (₹3.1–3.5 Cr, combining current measures and management commentary), against September 2026 headcount. It does not show how individual functions would scale. Each ₹0.5 Cr a year more per employee lowers the figure by about 450–580.

Source: HomeFirst Q2 FY27 investor presentation; Q1 and Q2 FY27 earnings calls; FY26 Integrated Annual Report (attrition). Staff range: FY30 disbursals ÷ ₹3.5 Cr (CEO figure) and ÷ ₹3.1 Cr (TTM disbursals ÷ current employees).

ROA has risen from 2.4% to 4.2% since FY19; ROE has stayed below 17% because each equity raise cut leverage

Source: HomeFirst investor presentation Q2 FY27, ten-year summary and ROE tree. FY22 ROA and ROE adjusted for the one-time deferred tax reversal. IPO February 2021 (FY21); QIP ₹1,250 Cr (FY26).

Asset returns have improved; the equity raise has temporarily diluted ROE

Return on equity
14.9%
Target: 15% exit FY27, 16% exit FY28

Return on assets
4.2%

	Total income	**13.9%**	Loans 11.5%, loan sales 0.9%, fees, treasury and other 1.5%
–	**Funding expense**	**5.5%**	Cost of borrowing 7.8%; 10 bps on borrowing cost = ₹8.8 Cr PAT
–	**Opex**	**2.6%**	Cost-to-income 30.8%; 10 bps of assets = ₹12.5 Cr PAT
–	**Credit cost**	**0.4%**	Gross Stage 3 1.7%; 10 bps of assets = ₹12.5 Cr PAT
–	**Tax**	**1.2%**	Effective rate about 23%

×

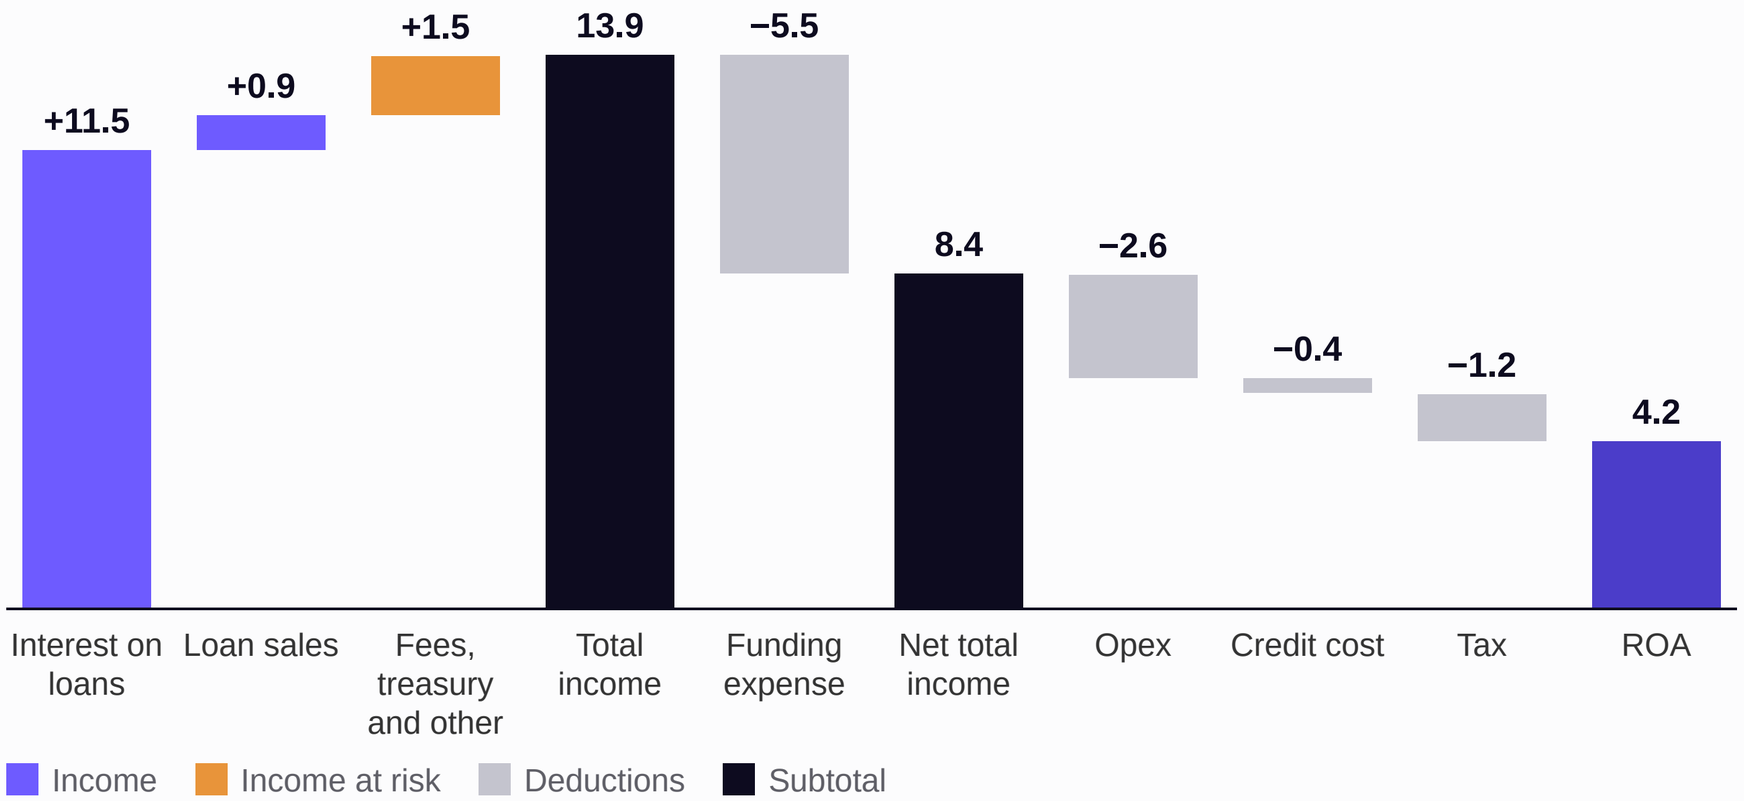

Leverage
3.6x

	Average assets ÷ average equity	**3.6x**	4.7x in FY25, before the QIP
	Capital adequacy (CRAR)	**39.8%**	Regulatory floor 15%; covenant floor 20%

Source: HomeFirst Q2 FY27 investor presentation, ROE tree (ratios to average total assets, annualised); Q2 FY27 call for targets. Unrounded, ROA 4.16% × leverage 3.58x = 14.9%; multiplying the rounded figures gives 15.1%. Sensitivity basis in A2.

Of the 13.9% HomeFirst earns on its assets, funding, opex, credit losses and tax take 9.7 points, leaving ROA of 4.2%

% of average total assets, Q2 FY27 annualised

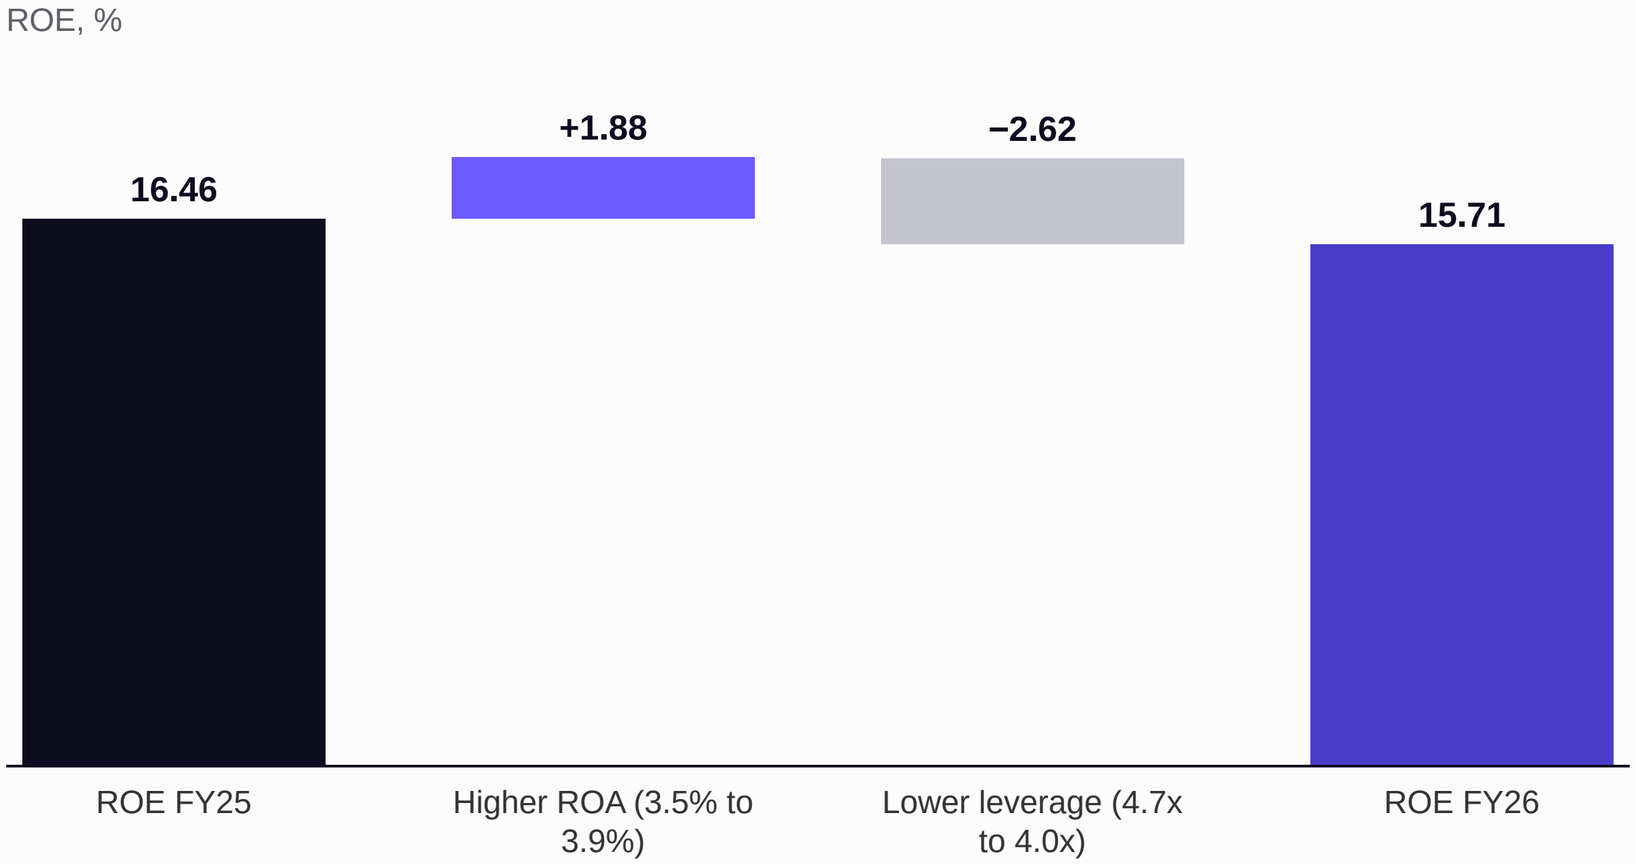

Insurance commission within fees is exposed; its contribution is undisclosed

Fees include insurance commission, earned since August 2024. FY26 fees rose 83% to ₹83 Cr.

Management sizes the draft insurance rule at about **35 bps of post-tax ROA**, roughly 45 bps pre-tax, or 30% of this bar.

Source: HomeFirst investor presentation Q2 FY27, ROE tree; FY26 Integrated Annual Report (fee income); Q2 FY27 earnings call (insurance rule impact). Totals may not add due to rounding.

In FY26 ROA rose 43 bps, yet ROE fell 75 bps because the ₹1,250 Cr QIP cut leverage from 4.7x to 4.0x

The business improved

ROA rose 43 bps on cheaper funding and operating leverage, worth +1.88 points of ROE.

The capital base grew faster

The ₹1,250 Cr QIP lifted net worth from ₹2,521 Cr to ₹4,357 Cr. Lower leverage cost 2.62 points of ROE.

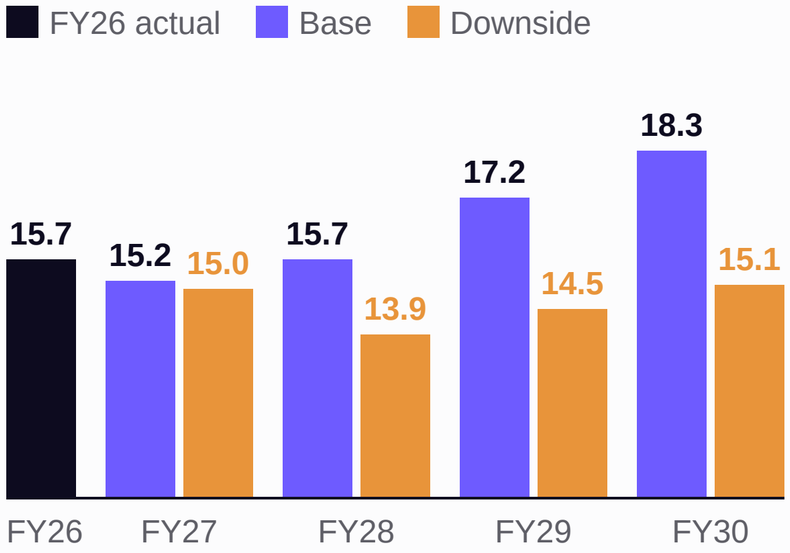

Management's own view

FY26 ROE before the new money was 16.8%, against 15.7% reported (method not disclosed).

Source: HomeFirst investor presentation Q2 FY27 (ROA, leverage, ROE); FY26 Integrated Annual Report (pre-money ROE 16.8%). Symmetric attribution on unrounded values: ROA effect = ΔROA × average leverage (+1.88); leverage effect = Δleverage × average ROA (−2.62). Values to two decimals; steps may differ from the total by 0.01 due to rounding.

ROE approaches 18% under the 25%-growth base case and 15% under the 20%-growth downside; capital headroom remains indicative

ROE, % (axis starts at 10%)

Base case	FY26	FY28	FY30
AUM, ₹ Cr	15,878	24,809	38,765
ROA, % (average)	3.9	4.0	4.0
Leverage, x (average)	4.0	4.0	4.5

CRAR, %*	44.1	38	35

**FY26 reported; later years indicative at Sep 2026 risk-weight density (A4).*

Source: Aistra outside-in model (assumptions A3, capital method A4), on rounded published ROA and 23% tax. Base: 25% AUM growth, insurance rule net of concession and mitigation, opex −10 bps a year. Downside: 20% growth, no concession, +20 bps credit cost, −10 bps spread

Structural funding drag: debt-funding the larger book costs 23–35 bps of ROA by FY30; opex gains offset most of it in the base case only

Change in post-tax ROA, percentage points, FY27 to FY30

Base case

ROA today (Q2 FY27)	**4.20%**
Debt-funding the larger book	−0.35
Insurance rule, net	−0.05
Opex −10 bps a year	+0.23
Credit cost	0.00
Spread	0.00
ROA FY30	**4.04%**

Downside case

ROA today (Q2 FY27)	**4.20%**
Debt-funding the larger book	−0.23
Insurance rule, net	−0.25
Opex −5 bps a year	+0.12
Credit cost +20 bps	−0.15
Spread −10 bps	−0.07
ROA FY30	**3.62%**

Why funding drag appears: equity funds about 28% of assets today at no interest cost. As the book grows faster than retained earnings, that falls to 21–24%, and the difference is borrowed at about 7.8%. This is the integrated version of the leverage effect: higher leverage lifts ROE but lowers ROA.

Source: Aistra outside-in model (appendix A3), on rounded published ROA (4.2%) and 23% tax. A long-run balance-sheet effect of growth funded with a smaller equity share; short-term rate changes are a separate question.

Higher-ROE peers report more self-employed borrowers, higher yields, slightly higher credit costs and lower leverage; periods and definitions differ

Lender	Period	Self-employed borrowers	Typical ticket	Spread	Credit cost	ROA	Leverage	ROE
HomeFirst	Q2 FY27	32%	₹12.3 L	5.2%	0.4%	4.2%	3.6x	14.9%
Aavas	Q2 FY27	62%	n.d.	5.0%	0.24%	3.3%	4.2x	13.6%
Aadhar	Q1 FY27	n.d.	n.d.	5.8%	0.4%	4.0%	3.7x	14.7%
India Shelter	Q1 FY27	majority	about ₹10 L	6.6%	0.5%	5.8%	3.0x	17.5%
Aptus	Q1 FY27	majority	about ₹10 L	9.0%	0.5%	7.8%	2.6x	20.4%

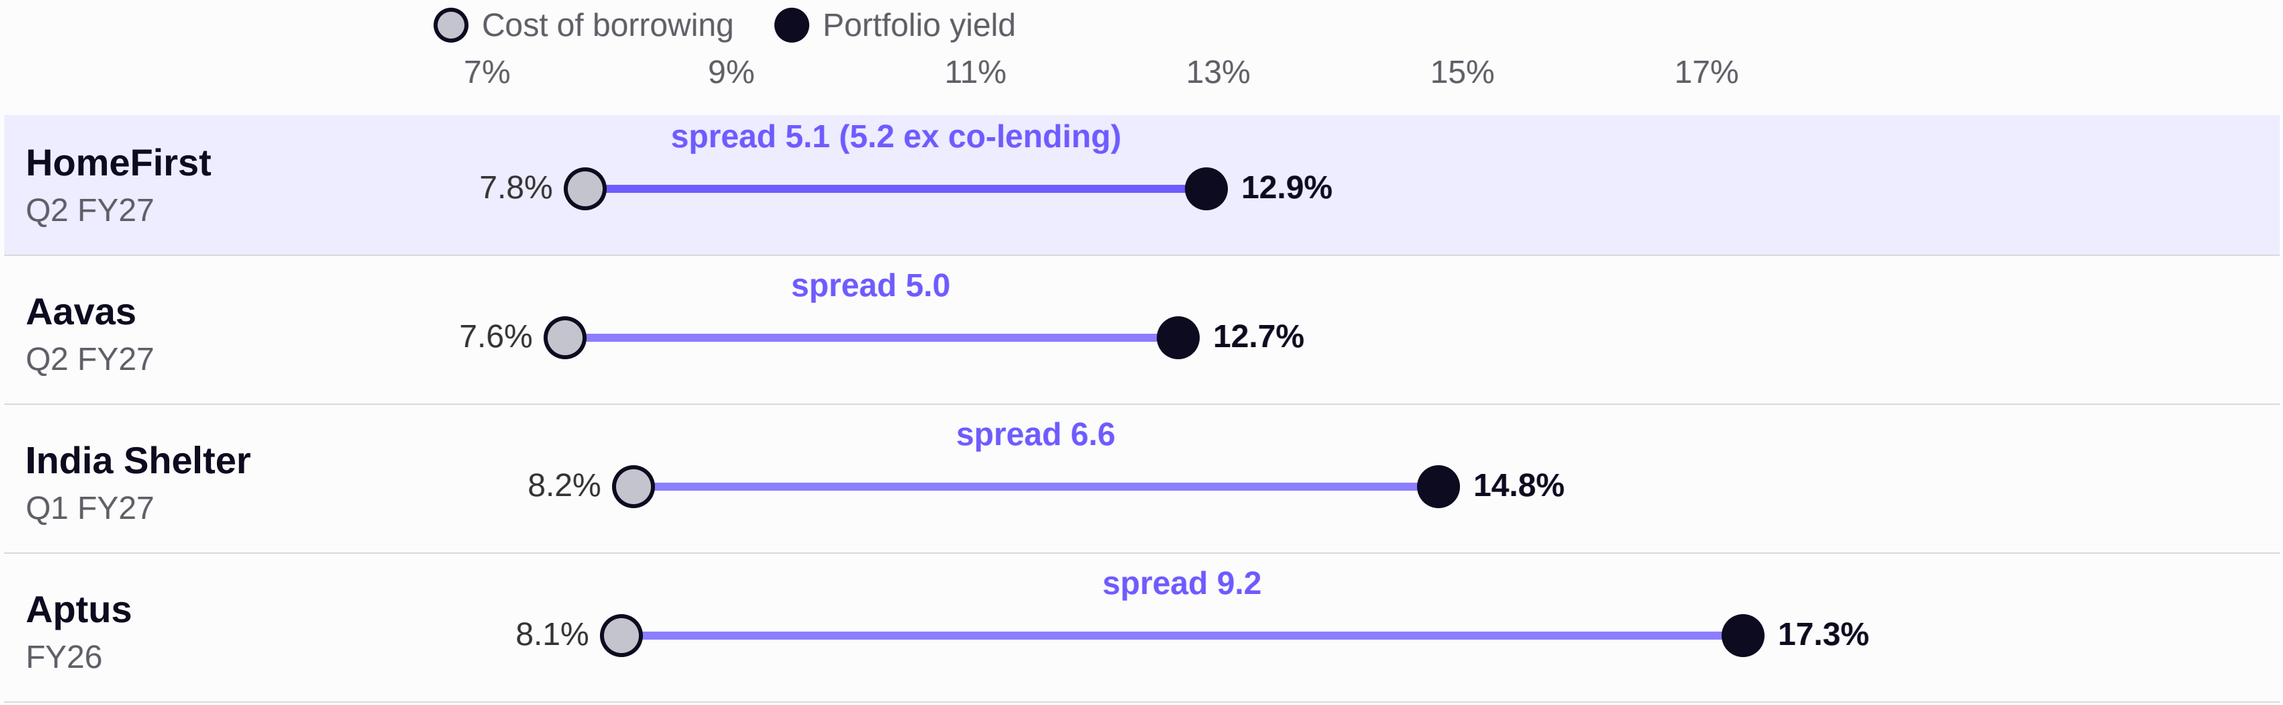

Observed: a different borrower
India Shelter and Aptus lend mostly to self-employed borrowers at smaller tickets, and report 1.4–3.8 points more spread.

Observed: higher ROA, lower leverage
Credit costs are slightly higher and leverage is 2.6–3.0x, so their higher ROE comes through ROA.

Not established by the data
How much of the yield gap pays for servicing and credit risk, and what a shift in mix would mean for a 68% salaried, 84% home-loan franchise.

Source: company results, investor presentations and calls; periods differ as shown. Leverage: HomeFirst as published (3.6x); peers ROE ÷ ROA. Self-employed share for India Shelter and Aptus stated as a majority, not quantified, in disclosures; n.d. = not disclosed.

Funding costs are within about 0.6 point across the group; spread differences sit in yield, alongside differences in borrower mix

Observed: higher yields at India Shelter and Aptus coincide with more self-employed borrowers, smaller tickets and slightly higher credit costs. **Not disclosed:** servicing cost and credit performance by segment, so the share of the yield gap that compensates for risk cannot be measured from public data.

Source: company results. Aptus yield is FY26 (17.3%) and cost of borrowing Q4 FY26 (8.1%), the latest disclosed; its reported spread is about 9.0%. Spreads shown are company-reported except Aptus (computed). Aadhar excluded: yield and cost not disclosed.

Public disclosures establish AI deployment; incremental benefits and process-level capacity remain unquantified

Area	Disclosed (type of evidence in bold)	What public data cannot tell us	Evidence needed to assess performance
Underwriting	**Reported usage:** ClariFi 30,000 files; BankLens 150,000 statements; DocIQ 400,000 documents. **Reported:** 87% approved within 48 hours	Why the 48-hour share fell from 91% (FY23) to 87%	Turnaround by stage and file type
Customer communication	**In production:** Cue handles 95% of calls in seven languages (reported)	How Cue data is used beyond servicing	Link from Cue signals to later delinquency
Collections	**In production:** automated soft-collection calls. **Reported:** October bounce 16.6%, attributed to calendar effects	Roll rates by cohort, branch and channel	Roll-rate baseline by cohort
Connector sourcing	**Reported:** 77% of leads from about 4,400 connectors; 94% on the app	Payout cost (inside yield) and credit performance by connector	Connector cost and quality comparison
Pricing and repricing	**Stated policy:** spread band 5.0–5.25%; reprice after a 10–15 bps funding move	Yield and credit cost by segment; repricing lag	Segment price and risk map; repricing timing
Finance and MIS	**Reported:** ROE tree published quarterly; turnaround, cohort and channel dashboards	How quickly plan against actual is seen by lever	Time from month end to lever-level view
AI roadmap	**Announced:** Phase 1 foundation to Mar 2027; Phase 2 Apr–Sep 2027; Phase 3 agentic decisions Oct 2027–Mar 2028	Adoption and measured benefit by phase	Adoption and outcome measures per phase

Source: HomeFirst Q2 FY27 investor presentation (AI roadmap, slide 15); Q1 and Q2 FY27 earnings calls. Reported usage is not incremental benefit. Questions, not conclusions: HomeFirst may already answer them internally, and undisclosed items may still be in place.

Public data shows rising asset returns and a clear growth requirement; whether operating capacity can keep pace is what it cannot show

What the evidence supports

- ROA rose to 4.2% from 3.5% in FY25, on cheaper funding and operating leverage
- ROE of 14.9% reflects leverage of 3.6x after the FY26 equity raise
- Reported asset-quality indicators are broadly stable at the cutoff (Gross Stage 3 1.7%); October bounce rate rose to 16.6%
- Operating cost is 2.6% of assets; management targets 10 bps lower each year
- AI tools are deployed with reported usage in underwriting and customer communication

What the scenarios imply, on stated assumptions

- At 25% annual growth from FY26, AUM roughly doubles by FY29 and reaches 2.4x by FY30; ROE rises towards 18% in the base case and stays near 15% at 20% growth with margin pressure
- On the stated capital method, neither case indicates a near-term equity need
- Funding drag takes 23–35 bps off ROA by FY30; the draft insurance rule puts up to 35 bps at risk
- Disbursals reach 2.4x FY26 by FY30; at constant productivity, a staffing sensitivity of 3,700–4,200 against 2,014 (Sep 2026)

What public data cannot establish

- Functional staffing, manual effort and incremental hiring requirements
- Benefits incremental to existing management plans
- Yield, credit cost and roll rates by segment, channel and cohort
- Connector payout cost and the credit performance of what connectors source
- Adoption and measured outcomes of the AI tools and roadmap phases
- The final form and timing of the insurance rule

Operating questions the evidence raises: can growth be absorbed through higher output per employee; does ROA hold as tickets rise and new markets open; how quickly does pricing follow funding costs?

Source: slides 4–13 and appendix A1–A8. Scenarios use rounded published ratios and the capital method in A4; they are conditional, not forecasts.

Aistra analysis	Doubling scenarios, sensitivities, capital method	Outside-in and conditional on stated assumptions

Sensitivities use reconciled Q2 FY27 balances and 23.4% tax; long-term scenarios use rounded ratios and 23% tax

Change	Applied to	Pre-tax ₹ Cr	PAT ₹ Cr	ROA, bps	ROE points at 3.58x
10 bps on average assets (opex, credit cost, fees)	₹16,381 Cr	16.4	12.5	7.7	0.27
10 bps of post-tax ROA (insurance rule)	₹16,381 Cr	21.4	16.4	10.0	0.36
10 bps on loan yield	₹14,560 Cr loans	14.6	11.2	6.8	0.24
10 bps on borrowing cost	₹11,530 Cr borrowings	11.5	8.8	5.4	0.19
Insurance rule after concession, before mitigation: 20–25 bps of ROA	₹16,381 Cr	43–53	33–41	20–25	0.7–0.9
Leverage +0.5x at constant ROA (static)	Equity	–	–	–	+2.1

Annual figures on Q2 FY27 average balances (30 Jun and 30 Sep 2026). Tax 23.4%, the Q2 effective rate. ROE points = ROA change × 3.58x. The leverage line is a static sensitivity; slide 10 shows the integrated effect, where higher leverage also lowers ROA. Scenarios on slides 9–10 use rounded published ratios and 23% tax.

Source: HomeFirst Q2 FY27 ROE tree (average assets ₹16,381 Cr; interest-earning loans 88.9% and interest-bearing borrowings 70.4% of average assets).

Model assumptions for the doubling scenarios

Assumption	Base	Downside	Basis
AUM growth a year	25%	20%	Management target 25%
Total assets ÷ AUM	95%	95%	Sep 2026: ₹17,185 Cr ÷ ₹18,010 Cr; loan sales and co-lending held off-book
Dividend payout	10%	10%	FY26 practice
Insurance rule, bps of ROA	−35 gross, +10 concession, +20 mitigation by FY29	−35 gross, no concession, +10 mitigation	Q2 FY27 call; rule assumed effective FY28
Opex, pre-tax bps of assets	−10 a year	−5 a year	Management target −10 bps a year
Credit cost, spread	Unchanged	+20 bps credit; −10 bps spread from FY28	Downside stress
Funding drag	Fall in equity share × 7.8% × (1 − 23%)	Same	Cost of borrowing Q2 FY27
Risk-weighted assets ÷ total assets	68%, sensitised to 80% in A4	68%	Implied by 39.8% CRAR at Sep 2026; regulatory capital approximated by net worth (A4)

Source: Aistra outside-in model. Not a forecast. Return ratios use average balances; capital ratios use closing balances.

Capital headroom is indicative: under the stated assumptions and a range of risk weights, neither scenario indicates a near-term equity requirement

1 Regulatory capital

Approximated by accounting net worth. Actual Tier 1 deducts items such as intangibles and deferred tax assets, which are not disclosed in enough detail to model. At Sep 2026, Tier 1 was 39.4% and total CRAR 39.8%.

2 Risk-weighted assets

Implied at 68% of total assets from the Sep 2026 CRAR, and held constant. Housing-loan risk weights vary with loan size and loan-to-value, and LAP carries higher weights, so larger tickets and more LAP would raise this ratio.

3 Measurement basis

Capital ratios use closing balances; ROA, leverage and ROE use average balances. The two are shown separately on slide 9.

Indicative CRAR under different risk-weight densities

Risk-weighted assets ÷ assets	Base FY28	Base FY30	Downside FY30
68% (Sep 2026 level)	36%	32%	35%
75%	32%	29%	31%
80%	30%	27%	29%
80%, with 5% of net worth deducted	29%	26%	28%

Every case stays above the 20% NCD covenant and the 15% regulatory minimum. Equity ÷ assets (closing) is 21.5% in the base case at FY30 and 23.5% in the downside.

Source: Aistra outside-in model; HomeFirst Q2 FY27 investor presentation (CRAR 39.8%, Tier 1 39.4%, net worth ₹4,665 Cr). Indicative CRAR = closing net worth less any deduction ÷ (risk-weight density × closing total assets).

Two supports under today's margin will weaken: surplus equity, which lifts NIM to 6.0%, and insurance fees under a draft rule

1. Surplus equity lifts NIM above spread

Interest-earning loans, % of average assets

88.9%

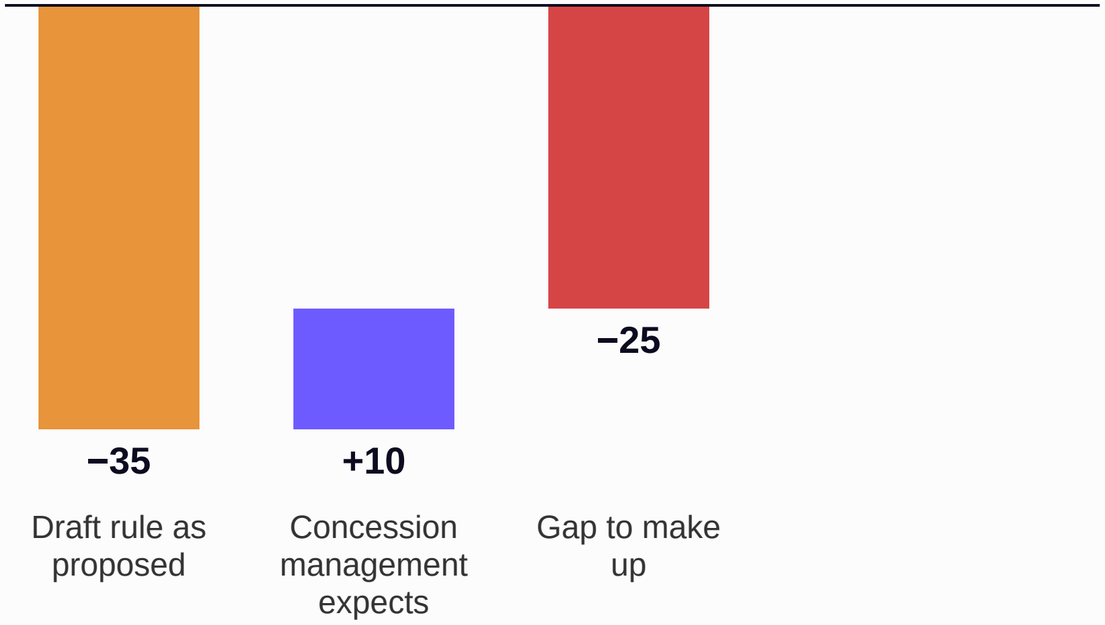

Interest-bearing borrowings, % of average assets

70.4%

Surplus equity helps support the gap between earning assets and interest-bearing liabilities, so **NIM is 6.0%** against a **5.2% spread**. A smaller equity share raises funding expense, all else equal; NIM and spread use different measurement bases and need not converge.

2. The insurance rule removes part of fee income

Bps of ROA

Management's stated levers: more LAP, more loan sales, small price or fee changes. After the concession the gap is 25 bps; management expects to recover about 20 of it, leaving about 5.

Source: HomeFirst investor presentation Q2 FY27, ROE tree (average interest-earning assets and interest-bearing liabilities); Q2 FY27 earnings call, 28 Oct 2026 (insurance rule). 25 bps of ROA ≈ ₹41 Cr of PAT a year.

Peer KPIs: HomeFirst shows strong growth and a low reported operating-cost ratio, with lower spread and higher Gross Stage 3 than most peers; periods and denominators differ

Lender	Period	AUM growth	Spread	Opex ratio	Credit cost	Gross Stage 3	ROA	ROE	States
HomeFirst	Q2 FY27	27%	5.2%	2.6% (assets)	0.4%	1.7%	4.2%	14.9%	13
Aavas	Q2 FY27	16%	5.0%	3.3% (assets)	0.24%	1.11%	3.3%	13.6%	15
Aadhar	Q1 FY27	18%	5.8%	n.d.	0.4%	1.31%	4.0%	14.7%	22
India Shelter	Q1 FY27	24%	6.6%	4.0% (AUM)	0.5%	1.5%	5.8%	17.5%	15
Aptus	Q1 FY27	21%	9.0%	2.7% (AUM)	0.5%	1.7%	7.8%	20.4%	5

Read as directional. Quarterly credit costs are seasonal (Aadhar's full-year guidance is 0.23–0.25%), and opex ratios use different denominators.

Source: company results and investor presentations. n.d. = not disclosed. Refresh after Q2 FY27 results for Aadhar (5 Nov 2026), India Shelter and Aptus.

Peer practices, as comparative evidence for HomeFirst's own franchise

Peer	Practice	Evidence	Implication requiring validation
Aavas	Monthly field-productivity tracking; tight collections on a harder book	1.25 files per officer per month in Q2; Gross Stage 3 1.11% with 62% self-employed borrowers	Can RM Pro data support the same tracking without adding reporting load?
Aadhar	State diversification; stage-gated new branches	22 states, no state above 15% of AUM; new branches productive in 9–15 months	Does a stage gate suit HomeFirst's slower self-construction markets?
Aptus	Risk-based pricing; explicit ROE-tree management	Yield about 17%; declines loans below ₹7 lakh; discusses its ROE tree on calls	Which segments could bear risk-based pricing within HomeFirst's credit policy?
India Shelter	In-house sourcing	₹10 lakh ticket at 52% LTV; 6.6% spread	Connector sourcing is a strength: where would in-house sourcing add, not replace?

Source: Aavas Q2 FY27 call; Aadhar Q1 FY27 call and Chola Securities initiation; Aptus Q4 FY26 and Q1 FY27 calls; India Shelter Q1 FY27 results.

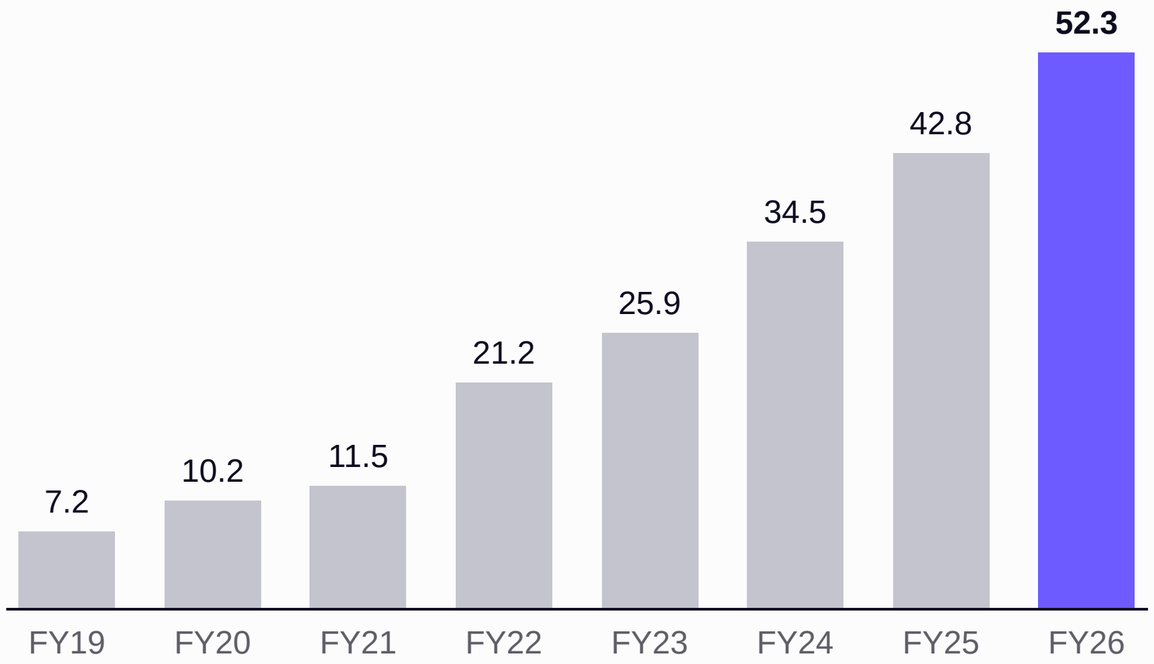

Six areas to investigate, each with an alternative reading that public data cannot rule out

Area	Observed metric	Concern it could indicate	Alternative reading
Sourcing	77% of leads from about 4,400 connectors; payouts inside yield	Sourcing cost not visible in opex	Broad, variable-cost distribution is a strength
Underwriting	40% of logins reach sanction; 48-hour approvals 87% vs 91% in FY23	Conversion or turnaround slipping	Screening discipline; more complex files as tickets rise
Disbursal	Co-lending ₹1.8 Cr in Q2 vs ₹46 Cr in Q1	Lost off-book income	Temporary pause while partners adopt new RBI rules
Servicing	App logins 40% of active customers, from 46%	Weaker engagement	Customers who need nothing from the app
Collections	Bounce rate 16.6% in October, 15.6% in Q2	Early stress	Calendar effect; last October was higher
Pricing	Repricing after a 10–15 bps funding move	Spread lag in a rising-rate cycle	Avoids frequent small changes for customers

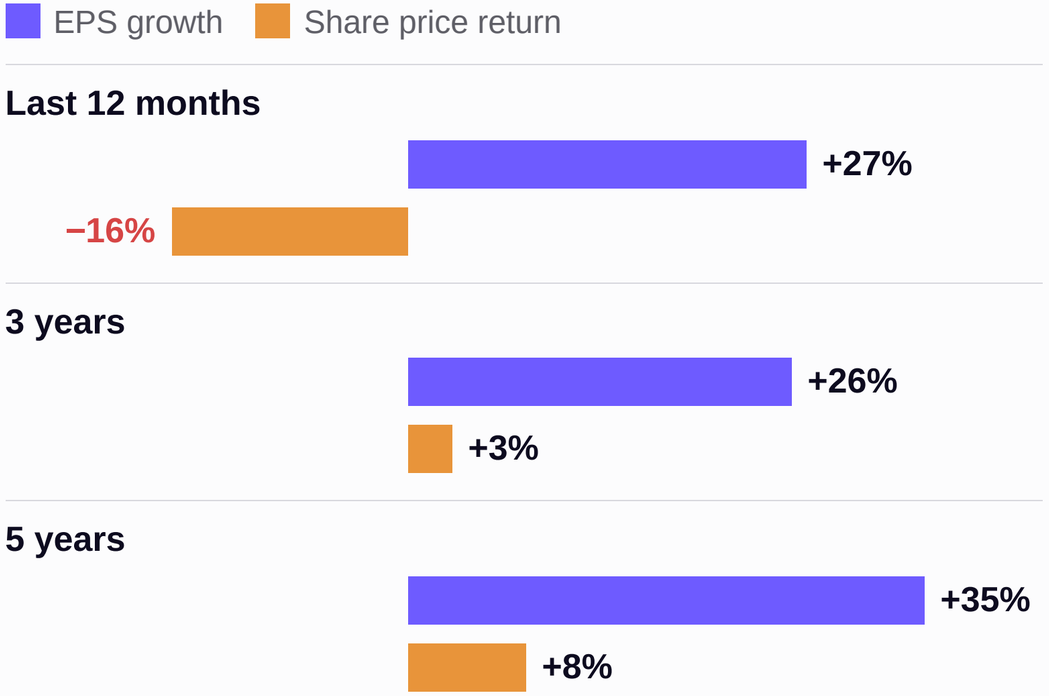

Source: HomeFirst Q2 FY27 investor presentation; Q1 and Q2 FY27 earnings calls.

EPS has compounded at 26–35% a year, but the share price has returned 3–8% a year and fallen 16% in the past year

Earnings per share, ₹

EPS growth against share price return, % a year

The gap points to a lower earnings multiple. Periods differ (EPS on financial years, price to October 2026), so its size is approximate.

Source: company basic EPS for FY25–FY26 (S1 slide 41); earlier years and price returns from Screener, to 28 Oct 2026. EPS growth: 3 years = FY23–FY26, 5 years = FY21–FY26, last 12 months = TTM to Sep 2026 vs prior TTM; price returns to 28 Oct 2026, so periods are not aligned. FY22 EPS includes a one-time deferred tax reversal. Price return excludes dividends (yield about 0.5%).
